

PARARIB FOR TUNNEL LINING AND SALVAGE OPERATIONS WEST YORKSHIRE, UNITED KINGDOM

ROCKFALL PROTECTION SYSTEMS

Rockfall Barriers (Catch fences and Canopies)

Editorial published in: United Kingdom

High strength synthetic mesh products

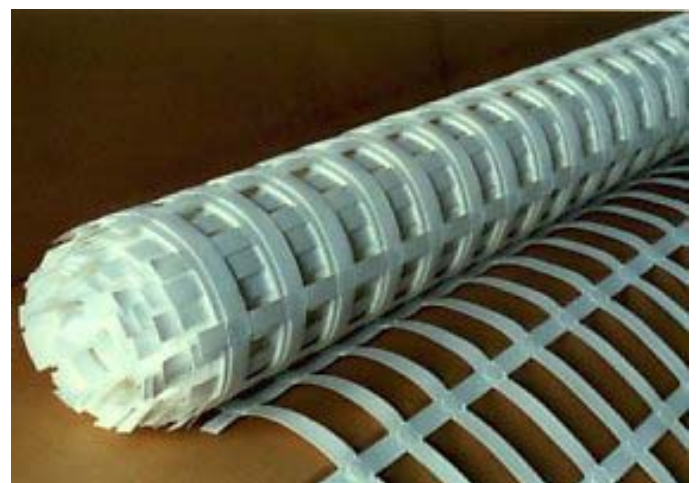

Linear Composites' PARARIB™ mesh products are ideal for controlling the loose debris that may fall from walls and roofs during mining activities. They are designed to be light in weight, flexible and extremely durable, perfect for handling in confined spaces.

PARARIB™ materials consist of high tenacity polyester fibres encased in a tough and durable white flame retardant sheath. The white sheath material enhances light reflectancy and visibility particularly in areas of limited illumination associated with underground mining operations. In a recent extension to the PARARIB™ range, orange coloured strips are inserted, at predetermined intervals, to aid the placement of rockbolts.

PARARIB™ can be supplied in a range of tensile strengths (in both length and across direction) to suit individual requirements. Various roll widths from 1.275 metres (4' 2") up to a maximum single width of 4.5 metres (14' 9") can be supplied. Roll lengths can also be varied to suit particular customer requirements.

Underground mining operation shows miners installing prop systems whilst PARARIB provides protection from loose debris.

PARARIB is shipped in rolls of various widths and is relatively easy to transport and store on site.
